Algorithm definition

New! An algorithm is a finite sequence of precise instructions for solving a problem.

Algorithms can be expressed in English or in more formalized descriptions like pseudocode or fully executable programs.

Sometimes, we can define algorithms whose output matches the rule for a function we already care about. Consider the (integer) logarithm function

$$logb: \{b \in \mathbb{Z} \mid b > 1\} \times \mathbb{Z}^+ \rightarrow \mathbb{N}$$

defined by

 $logb((b,n)) = greatest integer y so that b^y is less than or equal to n$

Calculating integer part of base b logarithm

```
procedure logb(b,n): positive integers with b > 1)

i := 0

while n > b - 1

i := i + 1

n := n div b

return i \{i holds the integer part of the base b logarithm of n}
```

Trace this algorithm with inputs b = 3 and n = 17

	b	n	$\mid i \mid$	n > b - 1?
Initial value	3	17		
After 1 iteration				
After 2 iterations				
After 3 iterations				

Compare: does the output match the rule for the (integer) logarithm function?

Base expansion algorithms

Two algorithms for constructing base b expansion from decimal representation

Most significant first: Start with left-most coefficient of expansion (highest value)

Informally: Build up to the value we need to represent in "greedy" approach, using units determined by base.

Calculating base b expansion, from left

```
procedure baseb1(n,b): positive integers with b>1)

v:=n

k:=1+ output of logb algorithm with inputs b and n

for i:=1 to k

a_{k-i}:=0

while v \ge b^{k-i}

a_{k-i}:=a_{k-i}+1

v:=v-b^{k-i}

return (a_{k-1},\ldots,a_0)\{(a_{k-1}\ldots a_0)_b \text{ is the base } b \text{ expansion of } n\}
```

Least significant first: Start with right-most coefficient of expansion (lowest value)

Idea: (when k > 1)

$$n = a_{k-1}b^{k-1} + \dots + a_1b + a_0$$

= $b(a_{k-1}b^{k-2} + \dots + a_1) + a_0$

so $a_0 = n \mod b$ and $a_{k-1}b^{k-2} + \cdots + a_1 = n \operatorname{div} b$.

Calculating base b expansion, from right

```
procedure baseb2(n,b): positive integers with b>1)

q:=n

k:=0

while q\neq 0

k:=q \mod b

k:=q \mod b

k:=k+1

return (a_{k-1},\ldots,a_0)\{(a_{k-1}\ldots a_0)_b \text{ is the base } b \text{ expansion of } n\}
```

Base conversion algorithm

Practice: write an algorithm for converting from base b_1 expansion to base b_2 expansion:
